

prompt: create an archery game. the game should have a start button. the game runs for 30 seconds. on the left there must be a bow which shoots arrows. there must be continuously moving target on the right of the screen. hitting the target must increase the score by 1. the image for the bow is bow.png. you can only use vanilla js html and css. do everything in the gpt.html file.

Model used: GPT 5.0 mini in github copilot

Analysis:

GPT game includes more design elements such as a gradient background for sky and grass. Whereas my implementation is a bit simpler. GPT game is smooth, however, my game has many cool features including a rotating bow and arrows following real projectile motion.
